

★ role and organisational fit

As a senior developer I have been already involved in decision making processes, gaining trust from different stakeholders, and driving teams / mentoring team mates along the way in a deliverable project.

My usual strategy is Agile / SCRUM. I apply this methodology with my own toolset of learnt skills. Most of these skills are just knowledge I've been acquiring along the many years of experience I already count under my belt. I pick what I like, what I see that works and I ditch or transform what is not fit for purpose. It is a constant adaptation methodology and it suits very well IT projects.

Managing projects, products and teams is something I understand very well and I put all my effort in making it streamline and easy for the communication to flow across different stakeholders.

I understand the risks of architectural decisions and how those affect the scalability, costs and reliability of the project as a whole and, when dealing with something as critical as Health, I understand perfectly well how important is for everything to work in tik-tok conditions.

During my time in the CQUniversity I was part of the Change Management Advisory Board due to my previous experience dealing with important decisions. I assessed architectural decisions and established the guidelines for new methodologies imprinting within the teams a more collaborative and Agile way of interact. I was some kind of internal consultant.

My extrovert character allows me to gain trust quickly and confidently get the best from everyone, bringing the team members together and injecting a strong team feeling across the departments making each and every individual feeling part of a global purpose so everyone feels proud of the part they collaborate with for the success of the project.

I am a strong believer in progressive change and improvement, that's the reason I like Agile and SCRUM so much.

These methodologies, when correctly apply, bring together different parts of the business and different stakeholders get to know what are the issues other parts are experiencing so they feel it closer and understand the importance of addressing them professionally.

SCRUM, in addition, gets everyone to talk, to express what they are doing, how are they doing it and any issue they may be experiencing along the way. I strongly believe communication is the key for a team to work correctly. In my current position I'm managing a multi-million project for sea ports where accountability is rampant as small issues can cost thousands of dollars. I drive it with a multicultural team and where those team members are in different geographical zones, as far as Germany, Thailand, Denmark, US, etc... without the proper management, the communication would break and the sprints wouldn't be met. I am very proud of being the only person without a manager title actually organising a high-level project using properly applied Agile methodologies across all DHL Australia and New Zealand where there are offices in Perth, Sydney, Melbourne, Brisbane, Auckland and Gold Coast.
