cover letter

Dear Mark Rehbein,

I'm taking the opportunity to contact you in regards to the vacant positions you have advertised on seek.com.au about Software Engineers - Research Data.

I saw the position and I couldn't hide the excitement I felt. I found myself as a great fit for the requirements listed in it, from the skills to the experience and, definitely, the attitude and motivation. Environmental Research… that'd be my dream job: making an impact, participating on research and transforming raw data into beautiful and user friendly representations, interfaces or API data points. And all of that in the beautiful tropical Queensland… what else!

I attached my curriculum on my application so you can see on it how there is a lot I can bring for your company, specially from the data representation point of view, in my current role on DHI Group / SeaPort, that is my day to day work allowing users to interact with very complex data through simple-to-use charting representations and maps on web apps.

I've worked before in projects using cutting edge technologies within start-up-like companies and more enterprise-oriented ones also. Also you can see on my cv that I worked developing systems to integrate with IoT and data analysis as a fullstack developer, which will be a huge advantage.

I've taken the role of product owner and project/team leader before with great success mentoring junior developers and integrating Agile methodologies. Those are roles I feel confortable performing and I'm not scare of challenges nor hard work.

I strongly believe that, thanks to my experience and skills, I am the right choice to help you in your next endeavours.

Hoping to get to talk to you soon.

Best regards,

Marcos Morales Rodrigo
